

Enrabace

Enrabacc

Enrabacc contains Enramycin HCl 8% w/w, a medicated feed additive which prevents necrotic enteritis in chicken.

Mode of Action:

Enramycin is a MurG inhibitor that participates in the peptidoglycan synthesis process in Gram-positive bacteria. MurG catalyzes the transglycosylation reaction in the final step of peptidoglycan biosynthesis. Inhibition of this step greatly reduces cell wall integrity, causing several cell lysis.

Advantage of Enramycin:

Enramycin is not absorbed by the intestinal tract, which reduces concern regarding residues in treated animal food.

Enrabacc

Indications:

For growth promotion in poultry and pigs. Helps to ease the incidences of sub-clinical necrotic enteritis in poultry and swine dysentery in pigs.

Benefits:

Improves gut health and reduces incidences of gut infections including necrotic enteritis.

Dosage:

Poultry: 63 to 125 gm per ton of feed.

Pigs: 63 to 250 gm per ton of feed.

Packing:

25 Kg Paper bag.
